

Unpacking and Glass Panel Handling Instruction

Use cutting tools delicately when opening your shipping box.

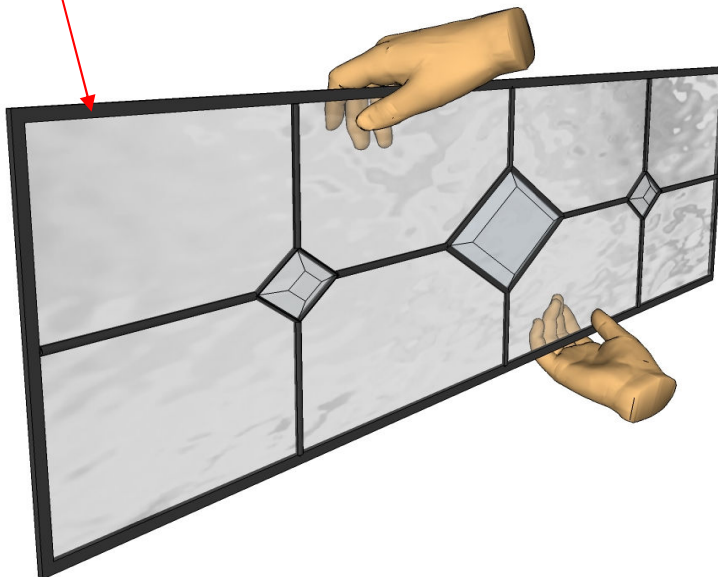

Remove your new panel(s) with extreme caution as shown below.

Do Not carry your glass panel at any time flat as shown.

Carry glass panels vertically as shown while holding the glass on top and supporting the bottom with your palm. Do Not lift or pull on the outer perimeter lead border as it may stretch and not return to its original shape.

Note: Lead perimeter will not support the weight of the panel. Lead is soft.

Another example of correctly carrying your leaded glass project by holding the glass and supporting the bottom.

It is recommended that you leave all panels inside the shipping box while you unload each panel(s). Removing the panels as a lump unit may require that you apply bending pressure in the flat (horizontal) position which will cause damage.

Additional instruction for the following are located on line via the How To Page.
